# On zero-sum game formulation of non zero-sum game* 

Yasuhito Tanaka ${ }^{\dagger}$<br>Faculty of Economics, Doshisha University, Kamigyo-ku, Kyoto, 602-8580, Japan.

#### Abstract

We consider a formulation of a non zero-sum $n$ players game by an $n+1$ players zerosum game. We suppose the existence of the $n+1$-th player in addition to $n$ players in the main game, and virtual subsidies to the $n$ players which is provided by the $n+1$-th player. Its strategic variable affects only the subsidies, and does not affect choice of strategies by the $n$ players in the main game. His objective function is the opposite of the sum of the payoffs of the $n$ players. We will show 1) The minimax theorem by Sion (Sion(1958)) implies the existence of Nash equilibrium in the $n$ players non zero-sum game. 2) The maximin strategy of each player in $\{1,2, \ldots, n\}$ with the minimax strategy of the $n+1$-th player is equivalent to the Nash equilibrium strategy of the $n$ players non zero-sum game. 3) The existence of Nash equilibrium in the $n$ players non zero-sum game implies Sion's minimax theorem for pairs of each of the $n$ players and the $n+1$-th player.

## 1 Introduction

We consider a formulation of a non zero-sum $n$ players game by an $n+1$ players zero-sum game. We suppose the existence of the $n+1$-th player in addition to $n$ players in the main game, and virtual subsidies to the $n$ players which is provided by the $n+1$-th player. Its strategic variable affects only the subsidies, and does not affect choice of strategies by the $n$ players in the main game. His objective function is the opposite of the sum of the payoffs of the $n$ players, then the game with $n+1$ players, $n$ players in the main game and the $n+1$-th player, is a zero-sum game.

We will show the following results.

1. The minimax theorem by Sion (Sion (1958)) implies the existence of Nash equilibrium in the $n$ players non zero-sum game.
2. The maximin strategy of each player in $\{1,2, \ldots, n\}$ with the minimax strategy of the $n+1$-th player is equivalent to the Nash equilibrium strategy of the $n$ players non zero-sum game.
3. The existence of Nash equilibrium in the $n$ players non zero-sum game implies Sion's minimax theorem for pairs of each of the $n$ players and the $n+1$-th player.

## 2 The model and the minimax theorem

There are $n$ players Player $1,2, \ldots, n$ in a non zero-sum game. The strategic variable of Player $i$ is denoted by $x_{i}$. The common strategy space of the players is denoted by $X$, which is a compact set. There exists another player, Player $n+1$. His strategic variable is $f$, We consider virtual subsidies to each player other than Player $n+1, \psi(f)$, which is provided by Player $n+1$ and is equal for any player. It is zero at the equilibrium.

The payoff of Player $i \in\{1,2, \ldots, n\}$ is written as

$$
\pi_{i}\left(x_{1}, x_{2}, \ldots, x_{n}, f\right)=\varphi_{i}\left(x_{1}, x_{2}, \ldots, x_{n}\right)+\psi(f), i \in\{1,2, \ldots, n\} .
$$

The objective function of Player $n+1$ is

$$
\pi_{n+1}=-\left(\pi_{1}+\pi_{2}+\ldots \pi_{n}\right)=-\sum_{i=1}^{n} \varphi_{i}\left(x_{1}, x_{2}, \ldots, x_{n}\right)-n \psi(f) .
$$

The strategy space of Player $n+1$ is denoted by $F$ which is a compact set. Player $n+1$ is not a dummy player because he can determine the value of its strategic variable. We assume

$$
\min _{f \in F} \psi(f)=0
$$

Denote

$$
a=\arg \min _{f \in F} \psi(f)
$$

We postulate that this is unique. The game with Player $1,2, \ldots, n$ and Player $n+1$ is a zero-sum game because

$$
\begin{aligned}
& \quad \pi_{1}\left(x_{1}, x_{2}, \ldots, x_{n}, f\right)+\pi_{2}\left(x_{1}, x_{2}, \ldots, x_{n}, f\right)+\cdots+\pi_{n}\left(x_{1}, x_{2}, \ldots, x_{n}, f\right) \\
& +\pi_{n+1}\left(x_{1}, x_{2}, \ldots, x_{n}, f\right)=0 .
\end{aligned}
$$

Sion's minimax theorem (Sion (1958), Komiya (1988), Kindler (2005)) for a continuous function is stated as follows.

Lemma 1. Let $X$ and $Y$ be non-void convex and compact subsets of two linear topological spaces, and let $f: X \times Y \rightarrow \mathbb{R}$ be a function that is continuous and quasi-concave in the first variable and continuous and quasi-convex in the second variable. Then

$$
\max _{x \in X} \min _{y \in Y} f(x, y)=\min _{y \in Y} \max _{x \in X} f(x, y) .
$$

We follow the description of this theorem in Kindler (2005).
Let $x_{k}$ 's for $k \neq i$ be given, then $\pi_{i}$ is a function of $x_{i}$ and $f$. We can apply Lemma $\square$ to such a situation, and get the following equation.

$$
\begin{equation*}
\max _{x_{i} \in X} \min _{f \in F} \pi_{i}\left(x_{1}, x_{2}, \ldots, x_{n}, f\right)=\min _{f \in F} \max _{x_{i} \in X} \pi_{i}\left(x_{1}, x_{2}, \ldots, x_{n}, f\right) . \tag{1}
\end{equation*}
$$

We assume that arg $\max _{x_{i} \in X} \min _{f \in F} \pi_{i}\left(x_{1}, x_{2}, \ldots, x_{n}, f\right), \arg \min _{f \in F} \max _{x_{i} \in X} \pi_{i}\left(x_{1}, x_{2}, \ldots, x_{n}, f\right)$ and so on are unique, that is, single-valued. We also assume that the best responses of players in any situation are unique.

## 3 The main results

Choice of $f$ by Player $n+1$ has an effect only on the fixed subsidy for each player. The optimal value of $f$ for Player $n+1$, which is equal to $a$, is determined independently of $x_{1}, x_{2}, \ldots$, $x_{n}$, and the optimal values of the strategic variables for Player $1,2, \ldots, n$ are determined independently of $f$. We have

$$
\pi_{i}\left(x_{1}, x_{2}, \ldots, x_{n}, f\right)-\psi(f)=\pi_{i}\left(x_{1}, x_{2}, \ldots, x_{n}, a\right)=\varphi_{i}\left(x_{1}, x_{2}, \ldots, x_{n}\right), i \in\{1,2, \ldots, n\}
$$

for any value of $f$. Thus,

$$
\arg \max _{x_{i} \in X} \pi_{i}\left(x_{1}, x_{2}, \ldots, x_{n}, f\right)=\arg \max _{x_{i} \in X} \pi_{i}\left(x_{1}, x_{2}, \ldots, x_{n}, a\right) \text { for any } f,
$$

and

$$
\begin{equation*}
\arg \min _{f \in F} \pi_{i}\left(x_{1}, x_{2}, \ldots, x_{n}, f\right)=a, i \in\{1,2, \ldots, n\} \tag{2}
\end{equation*}
$$

First we show the following result.

Theorem 1. 1. Sion's minimax theorem (Lemma (1) implies the existence of Nash equilibrium in the non zero-sum main game.
2. The maximin strategy of each player in $\{1,2, \ldots, n\}$ with the minimax strategy of Player $n+1$ is equivalent to its Nash equilibrium strategy of the non zero-sum main game.

Proof. Let $\left(\tilde{x}_{1}, \tilde{x}_{2}, \ldots, \tilde{x}_{n}\right)$ be the solution of the following equation.

$$
\left\{\begin{array}{l}
\tilde{x}_{1}=\arg \max _{x_{1} \in X} \min _{f \in F} \pi_{1}\left(x_{1}, \tilde{x}_{2}, \ldots, \tilde{x}_{n}, f\right) \\
\tilde{x}_{2}=\arg \max _{x_{2} \in X} \min _{f \in F} \pi_{2}\left(\tilde{x}_{1}, x_{2}, \tilde{x}_{3}, \ldots, \tilde{x}_{n}, f\right) \\
\ldots \\
\tilde{x}_{n}=\arg \max _{x_{n} \in X} \min _{f \in F} \pi_{n}\left(\tilde{x}_{1}, \tilde{x}_{2}, \ldots, \tilde{x}_{n-1}, x_{n}, f\right) .
\end{array}\right.
$$

Then, we have

$$
\begin{align*}
& \max _{x_{i} \in X} \min _{f \in F} \pi_{i}\left(\tilde{x}_{1}, \ldots, x_{i}, \ldots, \tilde{x}_{n}, f\right)=\min _{f \in F} \pi_{i}\left(\tilde{x}_{1}, \ldots, \tilde{x}_{i}, \ldots, \tilde{x}_{n}, f\right)  \tag{3}\\
= & \min _{f \in F} \max _{x_{i} \in X} \pi_{i}\left(\tilde{x}_{1}, \ldots, x_{i}, \ldots, \tilde{x}_{n}, f\right), i \in\{1,2, \ldots, n\} .
\end{align*}
$$

Since

$$
\pi_{i}\left(\tilde{x}_{1}, \ldots, \tilde{x}_{i}, \ldots, \tilde{x}_{n}, f\right) \leq \max _{x_{i} \in X} \pi_{i}\left(\tilde{x}_{1}, \ldots, x_{i}, \ldots, \tilde{x}_{n}, f\right), i \in\{1,2, \ldots, n\},
$$

and

$$
\min _{f \in F} \pi_{i}\left(\tilde{x}_{1}, \ldots, \tilde{x}_{i}, \ldots, \tilde{x}_{n}, f\right)=\min _{f \in F} \max _{x_{i} \in X} \pi_{i}\left(\tilde{x}_{1}, \ldots, x_{i}, \ldots, \tilde{x}_{n}, f\right), i \in\{1,2, \ldots, n\},
$$

we get

$$
\begin{align*}
& \arg \min _{f \in F} \pi_{i}\left(\tilde{x}_{1}, \ldots, \tilde{x}_{i}, \ldots, \tilde{x}_{n}, f\right)=\arg \min _{f \in F} \max _{x_{i} \in X} \pi_{i}\left(\tilde{x}_{1}, \ldots, x_{i}, \ldots, \tilde{x}_{n}, f\right),  \tag{4}\\
& i \in\{1,2, \ldots, n\} .
\end{align*}
$$

Because the game is zero-sum,

$$
\sum_{i=1}^{n} \pi_{i}\left(\tilde{x}_{1}, \ldots, x_{i}, \ldots, \tilde{x}_{n}, f\right)=-\pi_{n+1}\left(\tilde{x}_{1}, \ldots, x_{i}, \ldots, \tilde{x}_{n}, f\right) .
$$

Therefore, from (2)

$$
\begin{align*}
& \arg \min _{f \in F} \pi_{i}\left(\tilde{x}_{1}, \ldots, x_{i}, \ldots, \tilde{x}_{n}, f\right)  \tag{5}\\
= & \arg \max _{f \in F} \pi_{n+1}\left(\tilde{x}_{1}, \ldots, x_{i}, \ldots, \tilde{x}_{n}, f\right)=a, i \in\{1,2, \ldots, n\} .
\end{align*}
$$

From (3), (4) and (5) we obtain

$$
\begin{align*}
& \min _{f \in F} \max _{x_{i} \in X} \pi_{i}\left(\tilde{x}_{1}, \ldots, x_{i}, \ldots, \tilde{x}_{n}, f\right)=\max _{x_{i} \in X} \pi_{i}\left(\tilde{x}_{1}, \ldots, x_{i}, \ldots, \tilde{x}_{n}, a\right)  \tag{6}\\
= & \min _{f \in F} \pi_{i}\left(\tilde{x}_{1}, \ldots, \tilde{x}_{i}, \ldots, \tilde{x}_{n}, f\right)=\pi_{i}\left(\tilde{x}_{1}, \ldots, \tilde{x}_{i}, \ldots, \tilde{x}_{n}, a\right), i \in\{1,2, \ldots, n\}
\end{align*}
$$

(5) and (6) mean that $\left(x_{1}, x_{2}, \ldots, x_{n}, f\right)=\left(\tilde{x}_{1}, \tilde{x}_{2}, \ldots, \tilde{x}_{n}, a\right)$ is a Nash equilibrium of the zero-sum game with $n+1$ players.
$\tilde{x}_{1}, \tilde{x}_{2}, \ldots, \tilde{x}_{n}$ are determined independently of $f$. Thus,

$$
\max _{x_{i} \in X} \varphi_{i}\left(\tilde{x}_{1}, \ldots, x_{i}, \ldots, \tilde{x}_{n}\right)=\varphi_{i}\left(\tilde{x}_{1}, \ldots, \tilde{x}_{i}, \ldots, \tilde{x}_{n}\right), i \in\{1,2, \ldots, n\} .
$$

Therefore, $\left(\tilde{x}_{1}, \tilde{x}_{2}, \ldots, \tilde{x}_{n}\right)$ is a Nash equilibrium of the non zero-sum game with Player 1,2 , ..., $n$.

## Next we show

Theorem 2. The existence of Nash equilibrium in the $n$ players non zero-sum game implies Sion's minimax theorem for pairs of Player $i, i \in\{1,2, \ldots, n\}$ and Player $n+1$.

Proof. Let $\left(\tilde{x}_{1}, \tilde{x}_{2}, \ldots, \tilde{x}_{n}\right)$ be a Nash equilibrium of the $n$ players non zero-sum game. Consequently,

$$
\varphi_{i}\left(\tilde{x}_{1}, \ldots, \tilde{x}_{i}, \ldots, \tilde{x}_{n}\right) \geq \varphi_{i}\left(\tilde{x}_{1}, \ldots, x_{i}, \ldots, \tilde{x}_{n}\right) \text { for any } x_{i}, i \in\{1,2, \ldots, n\} .
$$

This is based on the fact that there exists a value of $x_{i}, x_{i}^{*}$, such that given $x_{1}, x_{2}, \ldots, x_{n}$ other than $x_{i}$,

$$
\varphi_{i}\left(x_{1}, \ldots, x_{i}^{*}, \ldots, x_{n}\right) \geq \varphi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}\right) \text { for any } x_{i}
$$

Thus,
$\pi_{i}\left(x_{1}, \ldots, x_{i}^{*}, \ldots, x_{n}, f\right) \geq \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, f\right)$ for any $x_{i}$ and any value of $f, i \in\{1,2, \ldots, n\}$,
Since

$$
\arg \min _{f \in F} \pi_{i}\left(x_{1}, \ldots, x_{i}^{*}, \ldots, x_{n}, f\right)=\arg \max _{f \in F} \psi(f)=a
$$

we have

$$
\begin{align*}
& \min _{f \in F} \max _{x_{i} \in X_{i}} \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, f\right) \leq \max _{x_{i} \in X_{i}} \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, a\right)  \tag{7}\\
= & \min _{f \in F} \pi_{i}\left(x_{1}, \ldots, x_{i}^{*}, \ldots, x_{n}, f\right) \leq \max _{x_{i} \in X_{i}} \min _{x_{n} \in x_{n}} \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, f\right), i \in\{1,2, \ldots, n-1\} .
\end{align*}
$$

On the other hand, since

$$
\min _{f \in F} \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, f\right) \leq \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, f\right),
$$

we have

$$
\max _{x_{i} \in X_{i}} \min _{f \in F} \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, f\right) \leq \max _{x_{i} \in X_{i}} \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, f\right) .
$$

This inequality holds for any $f$. Thus,

$$
\max _{x_{i} \in X_{i}} \min _{f \in F} \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, f\right) \leq \min _{f \in F} \max _{x_{i} \in X_{i}} \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, f\right) .
$$

With (7), we obtain

$$
\begin{equation*}
\max _{x_{i} \in X_{i}} \min _{f \in F} \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, f\right)=\min _{f \in F} \max _{x_{i} \in X_{i}} \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, f\right), \tag{8}
\end{equation*}
$$

given $x_{1}, x_{2}, \ldots, x_{n}$ other than $x_{i}$. (7) and (8) imply

$$
\begin{aligned}
& \max _{x_{i} \in X_{i}} \min _{f \in F} \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, f\right)=\max _{x_{i} \in X_{i}} \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, a\right), \\
& \min _{f \in F} \max _{x_{i} \in X_{i}} \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, f\right)=\min _{f \in F} \pi_{i}\left(x_{1}, \ldots, x_{i}^{*}, \ldots, x_{n}, f\right) .
\end{aligned}
$$

From

$$
\min _{f \in F} \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, f\right) \leq \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, a\right),
$$

and

$$
\max _{x_{i} \in X_{i}} \min _{f \in F} \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, f\right)=\max _{x_{i} \in X_{i}} \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, a\right),
$$

we have
$\arg \max _{x_{i} \in X_{i}} \min _{f \in F} \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, f\right)=\arg \max _{x_{i} \in X_{i}} \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, a\right)=x_{i}^{*}, i \in\{1,2, \ldots, n-1\}$.
We also have

$$
\max _{x_{i} \in X_{i}} \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, f\right) \geq \pi_{i}\left(x_{1}, \ldots, x_{i}^{*}, \ldots, x_{n}, f\right),
$$

and

$$
\min _{f \in F} \max _{x_{i} \in X_{i}} \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, f\right)=\min _{f \in F} \pi_{i}\left(x_{1}, \ldots, x_{i}^{*}, \ldots, x_{n}, f\right) .
$$

Therefore, we get
$\arg \min _{f \in F} \max _{x_{i} \in X_{i}} \pi_{i}\left(x_{1}, \ldots, x_{i}, \ldots, x_{n}, f\right)=\arg \min _{f \in F} \pi_{i}\left(x_{1}, \ldots, x_{i}^{*}, \ldots, x_{n}, f\right)=a, i \in\{1,2, \ldots, n-1\}$.
Thus, if $\left(x_{1}, x_{2}, \ldots, x_{n}\right)=\left(\tilde{x}_{1}, \tilde{x}_{2}, \ldots, \tilde{x}_{n}\right)$,

$$
\arg \max _{x_{i} \in X_{i}} \min _{f \in F} \pi_{i}\left(\tilde{x}_{1}, \ldots, x_{i}, \ldots, \tilde{x}_{n}, f\right)=\tilde{x}_{i}, i \in\{1,2, \ldots, n\} .
$$

## 4 An example

Consider a three firms oligopoly with differentiated goods. There are Firm 1, 2 and 3. Assume that the inverse demand functions are

$$
\begin{aligned}
& p_{1}=a-x_{1}-b x_{2}-b x_{3}, \\
& p_{2}=a-b x_{1}-x_{2}-b x_{3}, \\
& p_{3}=a-b x_{1}-b x_{2}-x_{3},
\end{aligned}
$$

with $0<b<1 . p_{1}, p_{2}, p_{3}$ are the prices of the goods of Firm 1,2,3. $x_{1}, x_{2}, x_{3}$ are the outputs of the firms. The cost functions of the firms with the subsidies are

$$
\begin{aligned}
& c_{1}\left(x_{1}\right)=c_{1} x_{1}-(f-a)^{2} \\
& c_{2}\left(x_{2}\right)=c_{2} x_{2}-(f-a)^{2}
\end{aligned}
$$

and

$$
c_{3}\left(x_{3}\right)=c_{3} x_{3}-(f-a)^{2}
$$

$f$ is a non-negative number and $a$ is a positive number. $c_{1}, c_{2}, c_{3}$ are constant numbers. The profits of the firms are

$$
\begin{aligned}
& \pi_{1}=\left(a-x_{1}-b x_{2}-b x_{3}\right) x_{1}-c_{1} x_{1}+(f-a)^{2} \\
& \pi_{2}=\left(a-b x_{1}-x_{2}-b x_{3}\right) x_{2}-c_{2} x_{2}+(f-a)^{2}
\end{aligned}
$$

and

$$
\pi_{3}=\left(a-b x_{1}-b x_{2}-x_{3}\right) x_{3}-c_{3} x_{3}+(f-a)^{2}
$$

The condition for minimization of $\pi_{1}$ with respect to $f$ is

$$
\frac{\partial \pi_{1}}{\partial f}=2(f-a)=0
$$

Thus, $f=a$. Substituting this into $\pi_{1}$,

$$
\left.\pi_{1}\right|_{f=a}=\left(a-x_{1}-b x_{2}-b x_{3}\right) x_{1}-c_{1} x_{1} .
$$

The condition for maximization of $\left.\pi_{1}\right|_{f=a}$ with respect to $x_{1}$ is

$$
\frac{\left.\partial \pi_{1}\right|_{f=a}}{\partial x_{1}}=a-2 x_{1}-b x_{2}-b x_{3}-c_{1}=0
$$

Thus,

$$
\arg \max _{x_{1} \in X} \min _{f \in F} \pi_{1}\left(x_{1}, x_{2}, x_{3}, f\right)=\frac{a-c_{1}-b x_{2}-b x_{3}}{2} .
$$

Similarly, we get

$$
\begin{aligned}
& \arg \max _{x_{2} \in X} \min _{f \in F} \pi_{2}\left(x_{1}, x_{2}, x_{3}, f\right)=\frac{a-c_{2}-b x_{1}-b x_{3}}{2}, \\
& \arg \max _{x_{3} \in X} \min _{f \in F} \pi_{3}\left(x_{1}, x_{2}, x_{3}, f\right)=\frac{a-c_{3}-b x_{1}-b x_{2}}{2} .
\end{aligned}
$$

Solving

$$
\begin{aligned}
& x_{1}=\frac{a-c_{1}-b x_{2}-b x_{3}}{2} \\
& x_{2}=\frac{a-c_{2}-b x_{1}-b x_{3}}{2}
\end{aligned}
$$

$$
x_{3}=\frac{a-c_{3}-b x_{1}-b x_{2}}{2},
$$

we obtain

$$
\begin{aligned}
& x_{1}=\frac{(2-b) a+b c_{3}+b c_{2}-(2+b) c_{1}}{2(2-b)(b+1)} \\
& x_{2}=\frac{(2-b) a+b c_{3}+b c_{1}-(2+b) c_{2}}{2(2-b)(b+1)} \\
& x_{3}=\frac{(2-b) a+b c_{1}+b c_{2}-(2+b) c_{3}}{2(2-b)(b+1)} .
\end{aligned}
$$

They are the same as the equilibrium outputs of the oligopoly with Firm 1, 2 and 3.
In this paper we presented a zero-sum game formulation of a non zero-sum $n$ players game considering the $n+1$-th player and virtual subsidies to the players provided by the $n+1$-th player.
